Isometric Engineering Drawing
Isometric drawing, method of graphic representation of three-dimensional objects, used by engineers, technical illustrators, and architects. The technique is intended to combine the illusion of depth, as in a perspective rendering, with the undistorted presentation of the object's principal dimensions.

Draw a square d'Ab'C od sides equal to the actual length of the edges of the cube with d'b' as the common diagonal. d'C is the actual length of the edge, whereas corresponding edge d'c' in the isometric projection is foreshortened. This foreshortened length is known as isometric length of the edge of the cube.

Last Updated on Wed, 26 Feb 2020 | Engineering Drawing. In isometric projection, the projection plane forms three equal angles with the co-ordinate axis. Thus, considering the isometric cube in Figure 2.4, the three cube axes are foreshortened to the same amount, i.e. AB = AC = AD. Two things result from this, firstly, the angles a = b = 30° and secondly, the rear (hidden) corner of the cube is coincident with the upper corner (corner D).

Isometric projection is a method for visually representing three-dimensional objects in two dimensions in technical and engineering drawings. It is an axonometric projection in which the three coordinate axes appear equally foreshortened and the angle between any two of them is 120 degrees. It's a pictorial orthographic projection of an object where a transparent cube containing the object is tilted before one of those solid diagonals of the cube becomes perpendicular to the vertical plane along

Isometric drawings show parts as three-dimensional. All the vertical lines stay vertical (compared to front view) and otherwise parallel lines are shown on a 30-degree angle. The lines that are vertical and parallel are in their true length.

An engineering drawing is a type of technical drawing that is used to convey information about an object. A common use is to specify the geometry necessary for the construction of a component and is called a detail drawing. Usually, a number of drawings are necessary to completely specify even a simple component. The drawings are linked together by a master drawing or assembly drawing which gives the drawing numbers of the subsequent detailed components, quantities required, construction materials

In an isometric drawing, the object's vertical lines are drawn vertically, and the horizontal lines in the width and depth planes are shown at 30 degrees to the horizontal. When drawn under these guidelines, the lines parallel to these three axes are at their true (scale) lengths.
